

I chose to recreate and customize a clone of the classic Flappy Bird game called the 'Floppy Fish' because I like how satisfying passing through the pipes is.

I implemented the movement controls with gravity and a flap mechanic, so when the player presses the spacebar, the fish moves up.

I also implemented pipe spawning and movement, background scrolling, Collision detection, a score counter, and several game modes (homepage, playing, and gameover). So when a player presses 'p' at the homepage, the game starts, and when the game is over, if 'ENTER' is pressed, the game restarts.

After the bird passes a pipe, one point is added to the score and when the player restarts, the score is reset to 0.

I created a custom underwater background that scrolls as the character advances in the stage, custom character sprite for the fish, and custom pipes. For audio, I add a bubble sound whenever the character jumps/flaps and a death sound when the character collides with the seabed/pipes so the player gets instant feedback both visually and auditorily when they play. I also used a pixel font to complete the overall look of the game.

One of the biggest challenges I faced was the mode change from homepage to playing to gameover: my code wasn't responding to whenever I pressed the 'P' or 'ENTER' button at first. I was stuck at that part for the longest time and then I realised I should've put the 'if' statement under the function keyPressed() and not under function draw() 😭
